

MATLAB Based Optimization Techniques and Parallel Computing

Bratislava June 4, 2009

Jörg-M. Sautter Application Engineer The MathWorks

Agenda

Introduction

Local and Smooth Optimization

Example:

Portfolio Optimization, part 1

Expected Shortfall

GARCH

Global or Non-Smooth Optimization Example:

Portfolio Optimization, part 2 Parallel Computing Summary

Optimization workflow

Major steps

- Define your problem
- Solve your problem $\notin @ duj p lq i+{, possibly subject to constraints Analyze and visualize the result$

Demands

- Appropriate solver
- Fast solver
- Robust solver
- Customizable solver settings
- Easy to use
- . . .

What you have to do

Situation

- You know your objective function
- You know the constraints (if there are any)

What you have to do

- Code your objective function (in MATLAB, C, C++, Excel,...)
- Code your constraints
- Determine the type of optimization problem
- Call the appropriate solver

Note: there are exceptions which are even easier to handle...

MATLAB Based Optimization Tools

- MATLAB
- Curve Fitting Toolbox
- Optimization Toolbox
- Genetic Algorithms and Direct Search Toolbox

as well as

- Statistics Toolbox
- Symbolic Math Toolbox

Optimization with MATLAB

- Direct methods for linear systems
 - square systems
 - LU-decomposition
 - Cholesky-decomposition
 - QR-decomposition
 - underdetermined systems
 - overdetermined systems
- Iterative methods for linear systems
 - cg-method (and variants)
 - GMRES, QMR, MINRES,...
- Polynomial approximation

• • • •

Agenda

Introduction

Local and Smooth Optimization

Example:

Portfolio Optimization, part 1

Expected Shortfall

GARCH

Global or Non-Smooth Optimization Example:

Portfolio Optimization, part 2 Parallel Computing Summary

Optimization Toolbox

- Graphical user interface and command line functions for:
 - Linear and nonlinear programming
 - Quadratic programming
 - Nonlinear least squares and nonlinear equations
 - Multi-objective optimization
 - Binary integer programming
- Customizable algorithm options
- Standard and large-scale algorithms
- Output diagnostics

Example: Minimum of a smooth function

Agenda

Introduction

Local and Smooth Optimization

Example:

Portfolio Optimization, part 1 Expected Shortfall GARCH Global or Non-Smooth Optimization Example:

Portfolio Optimization, part 2 Parallel Computing Summary

Example: Portfolio Optimization

Classic Mean-Variance

A portfolio is MV optimal if it has least risk for a given level of returns:

minimize	5@	z ^w Fz	$z 5 U^q > F 5 U^{q \S q}$
subject to	t w @	z ^w & [‰5 U ^q
	4@	z 1	
		1	
and possibly	3	z ₁ 4	
	Du	d> Eu@ e===	

Example: Expected Shortfall

Agenda

Introduction Local and Smooth Optimization Example: Portfolio Optimization, part 1 **Expected Shortfall** GARCH **Global or Non-Smooth Optimization** Example: Portfolio Optimization, part 2 Parallel Computing Summary

Genetic Algorithm and Direct Search Toolbox

- Graphical user interface and command line functions for:
 - Genetic algorithm solver
 - Direct search solver
 - Simulated annealing solver
- Useful for problems not easily addressed with Optimization Toolbox:
 - Discontinuous
 - Highly nonlinear
 - Stochastic
 - Discrete or custom data types

What is a Genetic Algorithm?

- Genetic Algorithms use concepts from *evolutionary biology* to find exact or approximate solutions to optimization problems
- Start with an initial generation of candidate solutions that are tested against the objective function
- Subsequent generations evolve from the 1st through selection, crossover and mutation
- The *individual* that best minimizes the given objective is returned as the ideal solution

Example: Minimum of a stochastic function

Agenda

Introduction Local and Smooth Optimization

Example:

Portfolio Optimization, part 1

Expected Shortfall

GARCH

Global or Non-Smooth Optimization

Example:

Portfolio Optimization, part 2 Parallel Computing Summary

Example: Custom Evolution Algorithms

- Encode which subset of equities to test using bit strings of 1's and 0's
- In this case, there are 30 bits with exactly 6 bits equal to 1
- In general, each bit string will have N bits with exactly K bits equal to 1
- It is inefficient to test every possible bit string. For N = 30, K = 6, there are 593,775 possible combinations!

Example: Custom Evolution Algorithms

- Selection
 - Retain the best performing bit strings from one generation to the next. Favor these for reproduction
- Crossover
 - parent1 = [1 0 1 0 0 1 1 0 0 0]
 - parent2 = [1 0 0 1 0 0 1 0 1 0]
 - $\text{ child } = [1 \ 0 \ 0 \ 0 \ 0 \ 1 \ 1 \ 0 \ 1 \ 0]$
- Mutation
 - parent = [1 0 1 0 0 1 1 0 0 0]
 - $\text{ child } = [0 \ 1 \ 0 \ 1 \ 0 \ 1 \ 0 \ 0 \ 1]$

Toolbox Comparison

	Optimization Toolbox	Genetic Algorithm and Direct Search Toolbox
Faster	\checkmark	
Can handle larger problems	\checkmark	
Better on non smooth, noisy, stochastic problems		~
More likely to find global solution		~
Can solve problems that involve custom data types		

Agenda

Introduction Local and Smooth Optimization Example: Portfolio Optimization, part 1 Expected Shortfall GARCH Global or Non-Smooth Optimization Example: Portfolio Optimization, part 2

Parallel Computing

Summary

Parallel Computing with MATLAB

- Why parallel computing?
 - How easy is it to use?
 - Licensing
 - Do I need special hardware?
 - Parallel computing and optimization

Large Data Set Handling

Workarounds

- Reduce Data
- Wait

Solutions

- Increase Addressable Memory
- Add Processors

calculation time

calculation time

number of machines

MATLAB[®] & SIMULINK[®]

Parallel Computing with MATLAB

- Why parallel computing?
- How easy is it to use?
 - Licensing
 - Do I need special hardware?
 - Parallel computing and optimization

The MathWorks

Distributing Tasks (Task Parallel)

Parallel for loops

```
parfor (i = 1 : n)
   % do something with i
end
```

- Mix task parallel and serial code in the same function
- Run loops on a pool of MATLAB resources
- Iterations must be order-independent
- M-Lint analysis helps to identify if existing for loops can be changed to parfor

Large Data Sets (Data Parallel)

Parallel Computing with MATLAB

- Why parallel computing?
- How easy is it to use?
- 실 🔹 Licensing
 - Do I need special hardware?
 - Parallel computing and optimization

he MathWorks

- Easy to experiment with explicit parallelism on multi-core machines
- Rapidly develop distributed and parallel applications on local computer
- Take full advantage of desktop power
- No separate compute cluster required

The MathWorks

Dynamic Licensing

Dynamic Licensing

Dynamic Licensing

Dynamic Licensing – Multiple Users

Parallel Computing with MATLAB

- Why parallel computing?
- How easy is it to use?
- Licensing
- Do I need special hardware?
 - Parallel computing and optimization

Supported on all MATLAB platforms

Parallel Computing with MATLAB

- Why parallel computing?
- How easy is it to use?
- Licensing
- Do I need special hardware?
- Parallel computing and optimization

Parallel Computing and Optimization

Both,

- the Optimization Toolbox and
- the Genetic Algorithms and Direct Search Toolbox

contain solvers which incorporate

- parallel optimization functionality,
- parallel estimation of gradients,
- nested parallel functions

provided the Parallel Computing Toolbox is available.

Parallel Computing with MATLAB

- Why parallel computing?
 - Process large amounts of data faster
- How easy is it to use?
 - Small modifications to your existing MATLAB programs
- Licensing
 - Dynamic!
- Do I need special hardware?
 - Windows, Linux, Solaris, or Mac are fine
- Parallel computing and optimization
 - Nicely integrated

Agenda

Introduction Local and Smooth Optimization Example: Portfolio Optimization, part 1 **Expected Shortfall** GARCH **Global or Non-Smooth Optimization** Example: Portfolio Optimization, part 2 Parallel Computing

Summary

Benefits

- Solvers for a wide range of optimization problems
- Easy to use
- Optimization supported by parallel computing
